

MIILIONS IN SWEDISH CURRENCY
BURIED NEEDLESSLY!

SWEDISH ENVIRONMENTAL TECHNOLOGY
HAS THE SOLUTION

Technology on the cutting edge

SET, Swedish Environmental Technology, is not a corporation but a network comprising highly-qualified Swedish environmental technology companies. Their goal is to permit access for you, the consumer, to environmental technology expertise through a network of Swedish companies. With our compiled skills and experience, we can offer efficient, cutting-edge and comprehensive environmental technology solutions. We can solve the environmental challenges faced by a single company or an entire city.

The highest qualifications are the most profitable SET is operated by a collection of companies which have derived their business concept from internal initiatives. In most cases, our proficiency is recognised the world over for the guaranteed latest and best-developed solutions available within environmental technology; solutions which are

cost-effective investments for our clients

Clean air preservation

The air we breathe may seem to be an endless resource, but the careless attitudes exhibited by industrial interests over the past century has forced us to realise that the opposite is true. For this reason, global authorities have implemented stricter demands concerning waste management while consu-

mers have begun boycotting companies that refuse to take their responsibility for curbing environmental impact. SET's network comprises several companies with documented competence and experience with regards to clean atmospheric emissions.

Minimise consumption

By implementing measures such as an efficient system for resource recycling as well as utilising waste incineration and subsequent waste heat recovery, SET solutions imply considerably lower energy costs and a substantial reduction in the use of natural resources. Sweden is among the world leaders with regards to energy extraction from waste and by-products.

This means that we can offer modern technological solutions for dismantling and recycling but more importantly, comprehensive solutions which minimise the use of resources for production.

Recycle water

Systems which contribute to reduced water usage and water recycling represent some of the more cost-effective investment alternatives available to companies. By halting a number of industrial processes, we can drastically reduce company

water consumption while diminishing contaminated water emissions. These measures would not only result in corporate profit increase but would also contribute towards improving the global environment. Treatment of water and other liquids are two of the core concerns at SET.

Restore the earth

Various forms of landfill deposits constitute one of the world's most troubling developments. Reduction of mountainous landfills and an end to dumping or improper handling of toxic waste which can lead to leakage into groundwater resources and other destruction are among our most important tasks. SET accepts the challenges presented by land remediation with the

employment of advanced technology and superior equipment. We can also offer a solution which efficiently prevents system contamination by utilising treatment and recycling.

Resource streamlining with SET companies

Our basic outlook concerns investments in environmental technology which, besides protecting our common environment from contaminants that threaten our globe and our future, imply economic profit for companies through efficient utilisation of natural resources.

Examples of our areas of expertise:

- Water
- Air
- Waste
- Ground decontamination
- Environmental supervision
- Clean technology
- Management
 - Life cycle analysis
 - Noise pollution
 - Energy

Russia
car wash water treatment
and re-circulation

Belgium
external noise reduction
at Stora Enso

Norway
central treatment plant with
cyclone-membrane and evaporation technology

England
waste water treatment plant
for Power Plants Raufoss

Iceland
waste water treatment plant
for Isafjodur-Envikraft

Finland
industrial process liquid treatment

The world's oceans
ballast water
purification for ships

Collaboration among Swedish
environmental companies

World-renowned competence

Latest and most
modern technology

A network path to over
50 leading-edge companies

Comprehensive solutions

Reliable offers

More cost-effective production

Continual contact with
researchers and universities
the world over

Improved environment and
reduced resource consumption

Guaranteed delivery
